Automata theory is the oldest among the disciplines constituting the subject matter of this Monograph Series: theoretical computer science. Indeed, automata theory and the closely related theory of formal languages form nowadays such a highly developed and diversified body of knowledge that even an exposition of "reasonably important" results is not possible within one volume.

The supremum (least upper bound) $\sup S$ of a set Automata and languages generalized to car-continuous semirings $139 S = f a; (i \in I \}$ or a sequence $S = (a; 1 \in I)$ of elements of a partially ordered set A is defined by (i) $a; \sup S$, for all $i \in I$, (ii) $a; ; c$ for all $i \in I$ implies $\sup S$, c . If the supremum exists, it is unique. A completely partially ordered set is a partially ordered set with a least element, such that for each w-chain the supremum exists. A partially ordered ...

This chapter presents basic foundations for the theory of weighted automata: semirings and formal power series. A fundamental question is how to extend the star operation (Kleene iteration) from languages to series. For this, we investigate ordered, complete and continuous semirings and the related concepts of star semirings and Conway semirings. We derive natural properties for the Kleene star of cycle-free series and also of matrices often used to analyze the behavior of weighted automata ...
