This course aims to fill the need for a comprehensive introduction to the analysis of biological systems in the continuum regime, in the context of transport (forces and fluxes). It aims to provide the student with the required skills to think-out-of-the-box in novelty requiring situations at one end, to a full appreciation of the relevant principles and their interconnections, at the other end. All the needed mathematical steps will be completely worked out to minimize the enormous time the ...

### Transport Phenomena in Biological Systems - Course

TRANSPORT PHENOMENA are especially important in medical and biological systems, and should be considered a fundamental subject for biomedical engineering education. The classical transport phenomena are considered to be heat conduction and diffusion mass transfer with the occasional addition of momentum transfer (also identified as fluid flow).

Transport phenomena encompass all agents of physical change in the universe. Moreover, they are considered to be fundamental building blocks which developed the universe, and which is responsible for the success of all life on earth. However, the scope here is limited to the relationship of transport phenomena to artificial engineered systems.
