The pre-Socratic philosopher Thales (640–546 BC), dubbed the "father of science", was the first to postulate non-supernatural explanations for natural phenomena. For example, that land floats on water and that earthquakes are caused by the agitation of the water upon which the land floats, rather than the god Poseidon.

History of science - Wikipedia

Science defined simply as knowledge of natural processes is universal among humankind, and it has existed since the dawn of human existence. The mere recognition of regularities does not exhaust the full meaning of science, however. In the first place, regularities may be simply constructs of the human mind. Humans leap to conclusions.

Academic study of the history of science as an independent discipline was launched by George Sarton at Harvard with his book Introduction to the History of Science (1927) and the Isis journal (founded in 1912). Sarton exemplified the early 20th century view of the history of science as the history of great men and great ideas. He shared with many of his contemporaries a Whiggish belief in history as a record of the advances and delays in the march of progress. The History of Science was not ...

Science, since people must do it, is a socially embedded activity. It progresses by hunch, vision, and intuition. Much of its change through time does not record a closer approach to absolute truth, but the alteration of cultural contexts that influence it so strongly. Facts are not pure and unsullied bits of information; culture also influences what we see and how we see it. Theories ...

The Origin of Science addresses one of the great mysteries of human evolution: How did the human mind evolve the ability to develop science? The art of tracking may well be the origin of science. Science may have evolved more than a hundred thousand years ago with the evolution of modern hunter-gatherers. Scientific reasoning may therefore be an innate ability of the human mind.

The timing of flowering-plant origins also provides a minimum age for the evolution of their most prominent feature: flowers. Insect pollination in many extant gymnosperms (e.g., cycads, Ephedra, Gnetum) is facilitated mainly by scent rather than by visual attraction. The same may have been true of the extinct gymnosperms, but because scent does not fossilize, it may be impossible to ever know.
